Introduction

The Cisco Intelligent WAN (IWAN) solution provides design and implementation guidance for organizations looking to deploy wide area network (WAN) transport with a transport-independent design (TID), intelligent path control, application optimization, and secure encrypted communications between branch locations while reducing the operating cost of the WAN. IWAN takes full advantage of cost-effective transport services in order to increase bandwidth capacity without compromising performance, reliability, or security of collaboration or cloud-based applications.

This document provides the available configuration files for the products used in the [Intelligent WAN Technology Design Guide](#). It is a companion document to the design guide as a reference for engineers who are evaluating or deploying the CVD.

Both this guide and the Intelligent WAN Technology Design Guide provide the complete list of products used in the lab-testing of this design.

The first design model is the IWAN Hybrid, which uses MPLS paired with Internet VPN as WAN transports. In this design model, the MPLS WAN can provide more bandwidth for the critical classes of services needed for key applications and can provide SLA guarantees for these applications. The second design model is the IWAN Dual Internet, which uses a pair of Internet service providers to further reduce cost while maintaining a high level of resiliency for the WAN. A third design model, the IWAN Dual MPLS, is not covered in this guide.

With this version of the guide, we have also added hub master controller (MC) high availability, hub border router (BR) scaling, and transit locations to the design. The high-level diagrams for these options are included below.

IOS Certificate Authority

Use this optional configuration if you want to deploy an IOS Certificate Authority (IOS CA) on a router in your DMZ with access from the internal network and the MPLS provider network. Skip this configuration if you are using pre-shared keys or if you plan to use a different certificate authority. You can create a more complex CA environment, but the same basic reachability principles will apply for an IWAN enabled solution.

You configure an IOS CA using a single internal LAN interface, which allows access from the hub routers and the remote sites. The remote sites access the IOS CA for authentication, as well as for obtaining their certificate after a DMVPN tunnel has been established with pre-shared keys.

How to Read Commands

This guide uses the following conventions for commands that you enter at the command-line interface (CLI).

Commands to enter at a CLI prompt:

```
configure terminal
```

Commands that specify a value for a variable:

```
ntp server 10.10.48.17
```

Commands with variables that you must define:

```
class-map [highest class name]
```

Commands at a CLI or script prompt:

```
Router# enable
```

Long commands that line wrap are underlined.

Enter them as one command:

```
police rate 10000 pps burst 10000  
packets conform-action
```

Noteworthy parts of system output (or of device configuration files) are highlighted:

```
interface Vlan64
```

```
ip address 10.5.204.5 255.255.255.0
```

WAN Aggregation Devices—IWAN Hybrid Design Model

Performance Routing Version 3 (PfRv3) consists of two major Cisco IOS components: an MC and a BR. The MC defines the policies and applies them to various traffic classes that traverse the BR systems. The MC can be configured to learn and control traffic classes on the network.

There are two different roles a device can play at the WAN aggregation site of a PfRv3 configuration:

- **Hub Master Controller**—The hub MC is the MC at the primary WAN aggregation site. This is the MC device where all PfRv3 policies are configured. It also acts as MC for that site and makes path-optimization decision. There is only one hub MC per IWAN domain.
- **Hub Border Router**—This is a BR at the hub MC site. This is the device where WAN interfaces terminate. There can be only one WAN interface on the device. There can be one or more hub BRs. On the Hub BRs, PfRv3 must be configured with:
 - The address of the local MC.
 - The path name on external interfaces.

The first design model is the IWAN Hybrid, which uses a primary MPLS transport paired with Internet VPN as a secondary transport. In this design, the MPLS WAN provides SLA class of service guarantees for key applications.

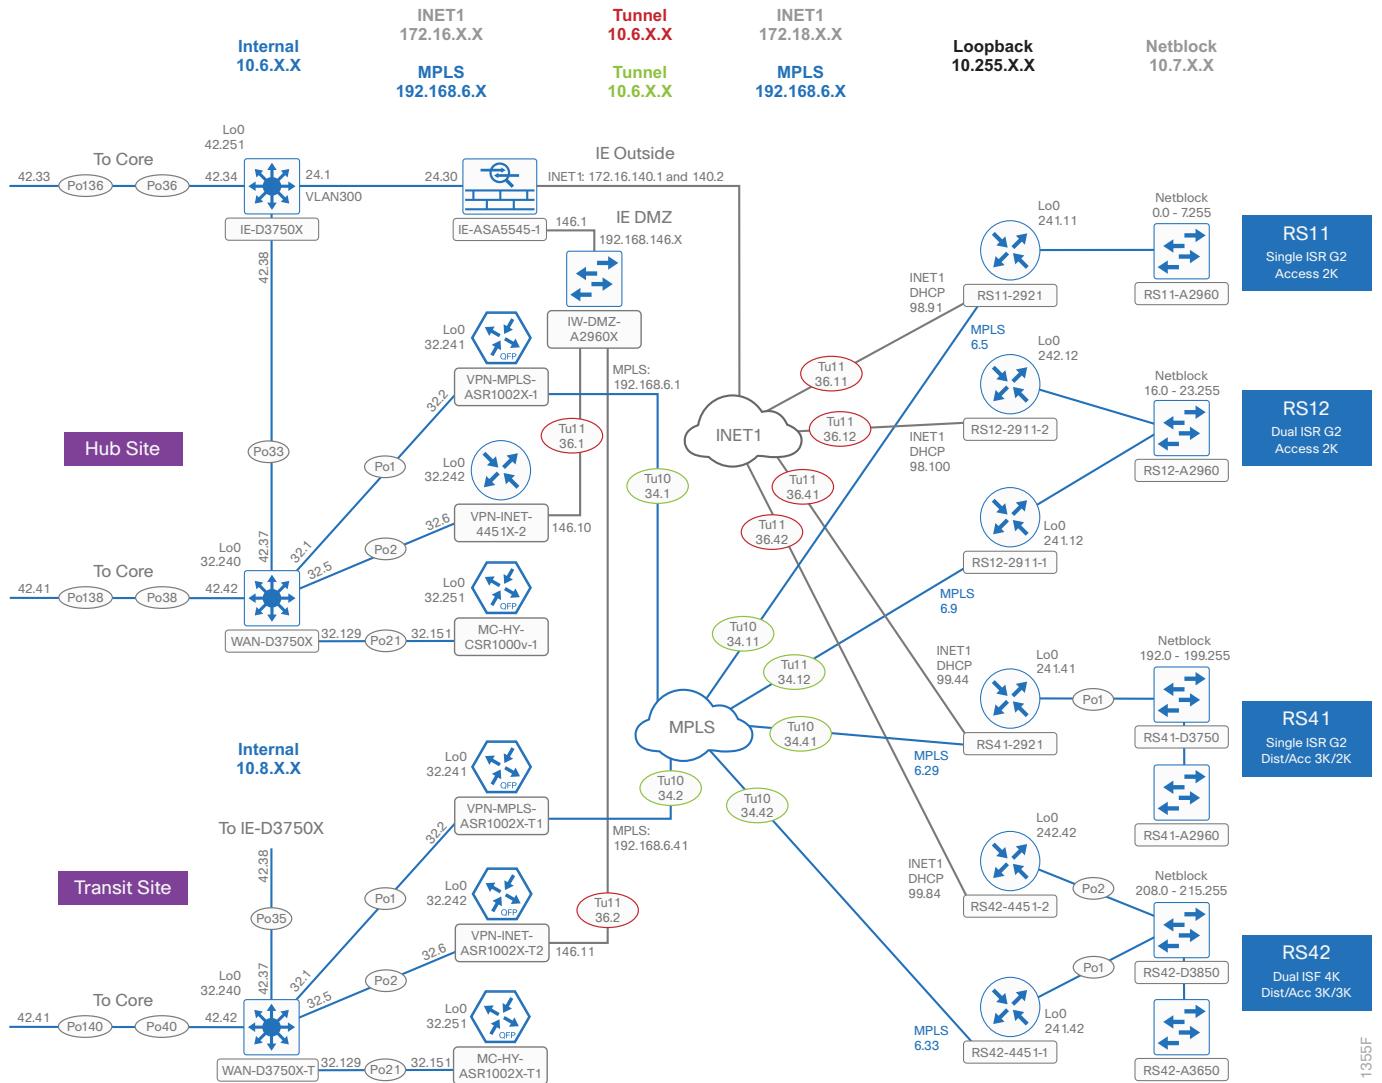

This version of the guide introduces the concept of a second data center acting as a transit site with a transit MC and transit BRs.

- **Transit Master Controller**—The transit MC is the MC at the transit site. There is no policy configuration on this device. It receives policy from the hub MC. This device acts as MC for that site for making path optimization decisions. The configuration includes the IP address of the hub MC.
- **Transit Border Router**—This is a BR at the transit MC site. This is the device where WAN interfaces terminate. There can only be one WAN interface on the device. There can be one or more transit BRs. On the transit BRs, PfRv3 must be configured with:
 - The address of the transit MC.
 - The path name on external interfaces.
 - The path ID on external interfaces.

This section includes configuration files corresponding to the IWAN hybrid model WAN aggregation hub and transit sites, as referenced in the figure below.

The following table provides the loopback and port-channel IP addresses for the WAN aggregation devices in the IWAN hybrid design model.

Table 1 IWAN hybrid model—Hub router IP addresses

WAN Remote-Site Devices—IWAN Hybrid Design Model

Performance Routing Version 3 (PfRv3) consists of two major Cisco IOS components: an MC and a BR. The MC defines the policies and applies them to various traffic classes that traverse the BR systems. The MC can be configured to learn and control traffic classes on the network.

There are two different roles a device can play at the remote site of a PfRv3 configuration:

- **Branch Master Controller**—The Branch MC is the MC at the branch-site. There is no policy configuration on this device. It receives policy from the Hub MC. This device acts as MC for that site for making path-optimization decision. The configuration includes the IP address of the hub MC.
- **Branch Border Router**—This is a BR at the branch-site. The configuration on this device enables BR functionality and includes the IP address of the site local MC. The WAN interface that terminates on the device is detected automatically.

The first design model is the IWAN Hybrid, which uses a primary MPLS transport paired with Internet VPN as a secondary transport. In this design, the MPLS WAN provides SLA class of service guarantees for key applications.

This section includes configuration files corresponding to the IWAN hybrid design model remote site, as referenced in the figure below.

Figure 9 IWAN hybrid model—WAN remote-site details

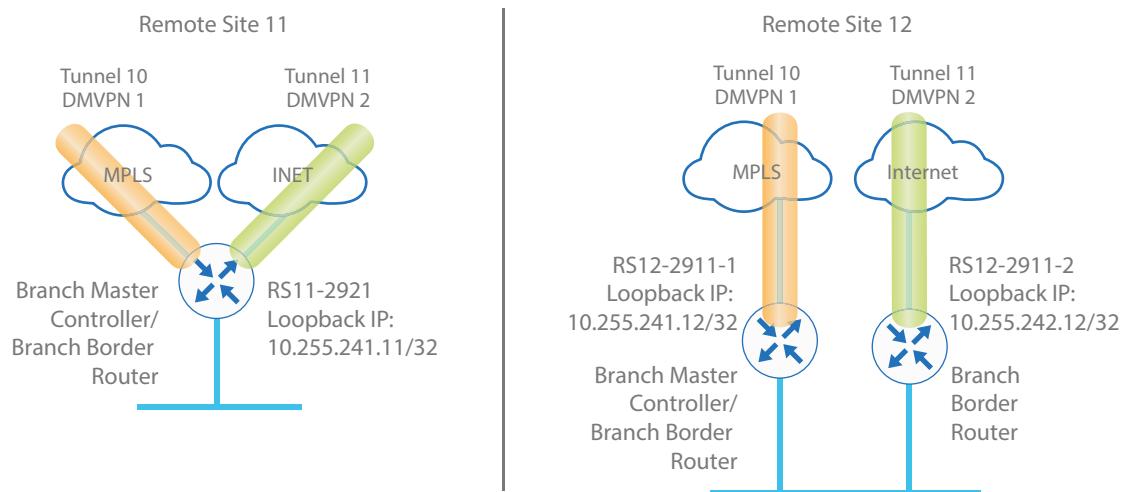

Table 2 Remote site router loopback IP addresses

IWAN function	Host name	Loopback IP address
Branch MC/BR (MPLS/INET)	RS11-2921	10.255.241.11/32
Branch MC/BR (MPLS)	RS12-2911-1	10.255.241.12/32
Branch BR (INET)	RS12-2911-2	10.255.242.12/32
Branch MC/BR (MPLS/INET)	RS51-2921	10.255.241.51/32

REMOTE SITE 11—SINGLE-ROUTER, DUAL-LINK (MPLS AND INET)

The following table lists the policed-rate link speeds for the remote-site quality-of-service (QoS) traffic-shaping policies and Performance Routing (PfR) policies.

Table 3 Remote-site policed-rate link speeds and delay

Location	MPLS link speed/delay	INET link speed/delay
Remote Site 11	30 Mbps/10000 us	20 Mbps/20000 us

REMOTE SITE 51—SINGLE-ROUTER, DUAL-LINK (MPLS AND INET WITH 4G LTE FALBACK)

This section includes configuration files corresponding to the IWAN hybrid design model with 4G LTE fallback, as referenced in the figure below.

Figure 10 IWAN hybrid model—WAN remote-site details with 4G LTE

The following table lists the policed-rate link speeds for the remote-site QoS traffic-shaping policies and PfR policies.

Table 5 Remote-site policed-rate link speeds and delay

Location	MPLS link speed/ delay	INET link speed/ delay	4G link speed/ delay
Remote Site 51	30 Mbps/ 10000 us	10 Mbps/ 20000 us	8 Mbps/ N/A

WAN Aggregation Devices—IWAN Dual Internet Design Model

Performance Routing Version 3 (PfRv3) consists of two major Cisco IOS components: an MC and a BR. The MC defines the policies and applies them to various traffic classes that traverse the BR systems. The MC can be configured to learn and control traffic classes on the network.

There are two different roles a device can play at the WAN aggregation site of a PfRv3 configuration:

- **Hub Master Controller**—The hub MC is the MC at the primary WAN aggregation site. This is the MC device where all PfRv3 policies are configured. It also acts as MC for that site and makes path-optimization decision. There is only one hub MC per IWAN domain.
- **Hub Border Router**—This is a BR at the hub MC site. This is the device where WAN interfaces terminate. There can be only one WAN interface on the device. There can be one or more hub BRs. On the Hub BRs, PfRv3 must be configured with:
 - The address of the local MC.
 - The path name on external interfaces.

The second design model is the IWAN dual Internet, which uses a pair of Internet service providers to further reduce cost while leveraging PfR in order to mitigate network performance problems on a single Internet provider.

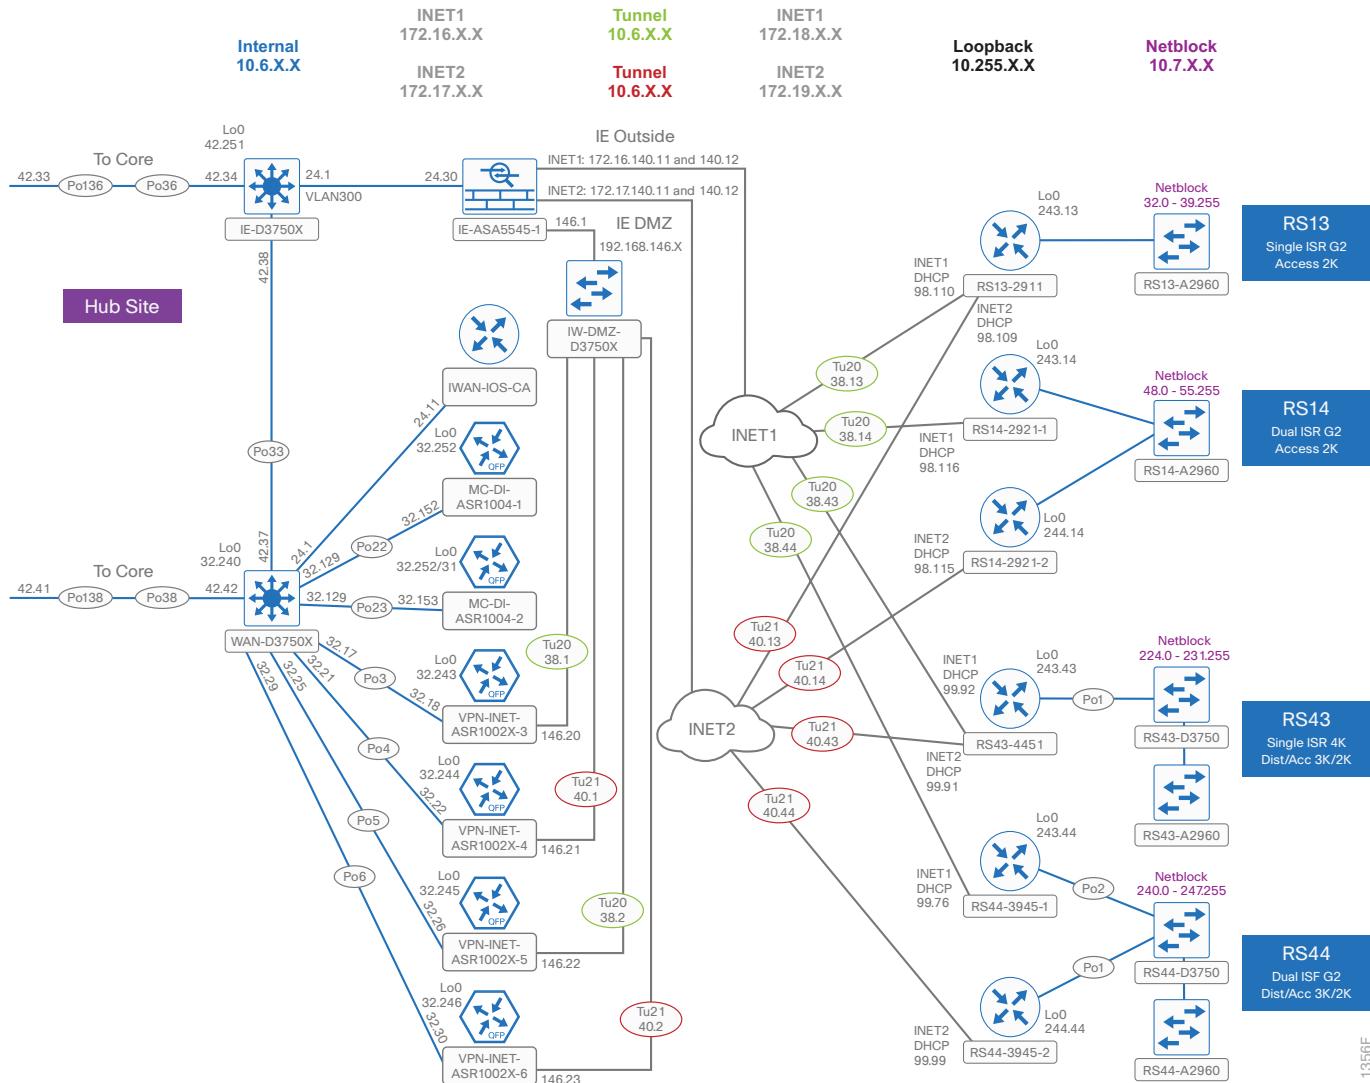

This version of the guide introduces hub MC HA and hub BR scaling.

This section includes configuration files corresponding to the IWAN dual Internet design model WAN aggregation site, as referenced in the figure below.

Figure 11 IWAN dual Internet model—Hub MC HA, hub BR scaling and IOS CA

To view a larger version of this figure, see [Appendix C](#).

The following table provides the loopback addresses for the WAN aggregation devices in the IWAN dual Internet model.

Table 6 IWAN dual Internet model—Hub router IP addresses

IWAN function	Host name	Loopback IP address	Port channel IP address
Hub MC	MC-DI-ASR1004-1	10.6.32.252/32	10.6.32.152/26

WAN Remote-Site Devices—IWAN Dual Internet Design Model

Performance Routing Version 3 (PfRv3) consists of two major Cisco IOS components: an MC and a BR. The MC defines the policies and applies them to various traffic classes that traverse the BR systems. The MC can be configured to learn and control traffic classes on the network.

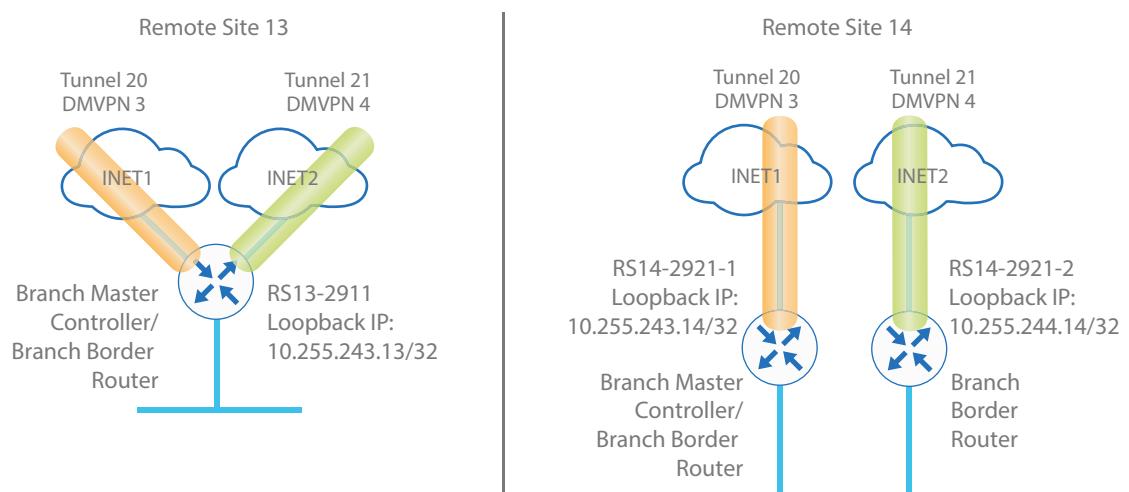

There are two different roles a device can play at the remote site of a PfRv3 configuration:

- **Branch Master Controller**—The Branch MC is the MC at the branch-site. There is no policy configuration on this device. It receives policy from the Hub MC. This device acts as MC for that site for making path-optimization decision. The configuration includes the IP address of the hub MC.
- **Branch Border Router**—This is a BR at the branch-site. The configuration on this device enables BR functionality and includes the IP address of the site local MC. The WAN interface that terminates on the device is detected automatically.

The second design model is the IWAN Dual Internet, which uses a pair of Internet service providers to further reduce cost while leveraging PfR in order to mitigate network performance problems on a single Internet provider.

This section includes configuration files corresponding to the IWAN dual Internet design model remote site, as referenced in the figure below.

Figure 12 IWAN dual Internet model—WAN remote-site designs

1247F

The following table provides the loopback addresses for the WAN remote site devices in the IWAN dual Internet design model.

Table 7 Remote site router loopback IP addresses

IWAN function	Host name	Loopback IP address
Branch MC/BR (INET1/INET2)	RS13-2911	10.255.243.12/32
Branch MC/BR (INET1)	RS14-2921-1	10.255.243.14/32
Branch BR (INET2)	RS14-2921-2	10.255.244.14/32

REMOTE SITE 13—SINGLE-ROUTER, DUAL-LINK (INET1 AND INET2)

The following table lists the policed-rate link speeds for the remote-site QoS traffic-shaping policies and PfR policies.

Table 8 Remote-site policed-rate link speeds and delay

Location	INET1 link speed/ delay	INET2 link speed/ delay
Remote Site 13	10 Mbps/ 10000 us	10 Mbps/ 20000 us

REMOTE SITE 14—DUAL-ROUTER, DUAL-LINK (INET1 AND INET2)

The following table lists the policed-rate link speeds for the remote-site QoS traffic-shaping policies and PfR policies.

Table 9 Remote-site policed-rate link speeds and delay

Location	INET1 link speed/ delay	INET2 link speed/ delay
Remote Site 14	10 Mbps/ 10000 us	10 Mbps/ 20000 us

Appendix B: Expanded Figure

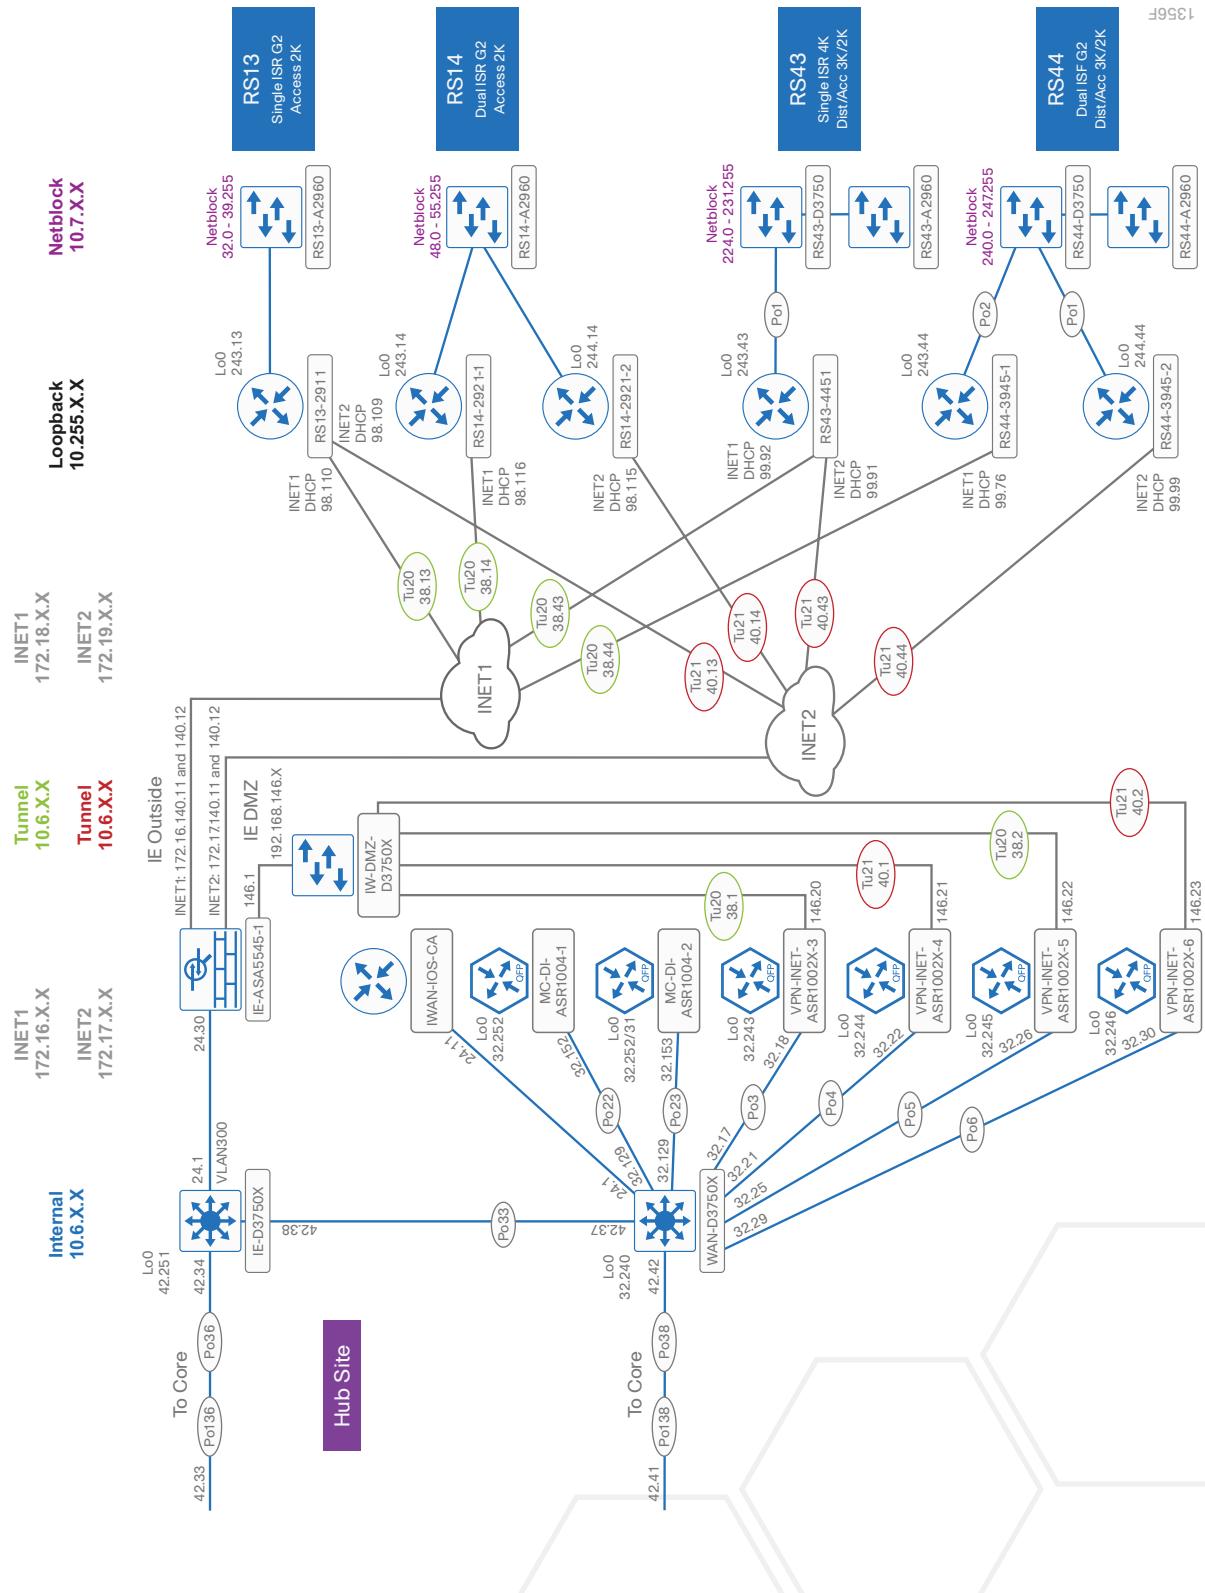

This appendix provides a larger version of Figure 8, “IWAN Hybrid Model—Second DC as a transit site.”

[Return to previous location in document](#)

Appendix C: Expanded Figure

This appendix provides a larger version of Figure 11, “IWAN dual Internet model—Hub MC HA, hub BR scaling and IOS CA.” [Return to previous location in document](#)

Appendix D: Changes

This appendix summarizes the changes Cisco made to this guide since its last edition.

- We upgraded IOS software.
- We updated the QoS settings.
- We updated the EIGRP settings.
- We updated the NHRP settings.
- We updated the PfR policy settings.
- We simplified the IOS CA configuration.
- We added a virtual router hub master controller.
- We added hub master controller high availability.
- We added hub border router scalability.
- We added a second data center as a transit site.
- We added Prime Infrastructure for IWAN monitoring.
